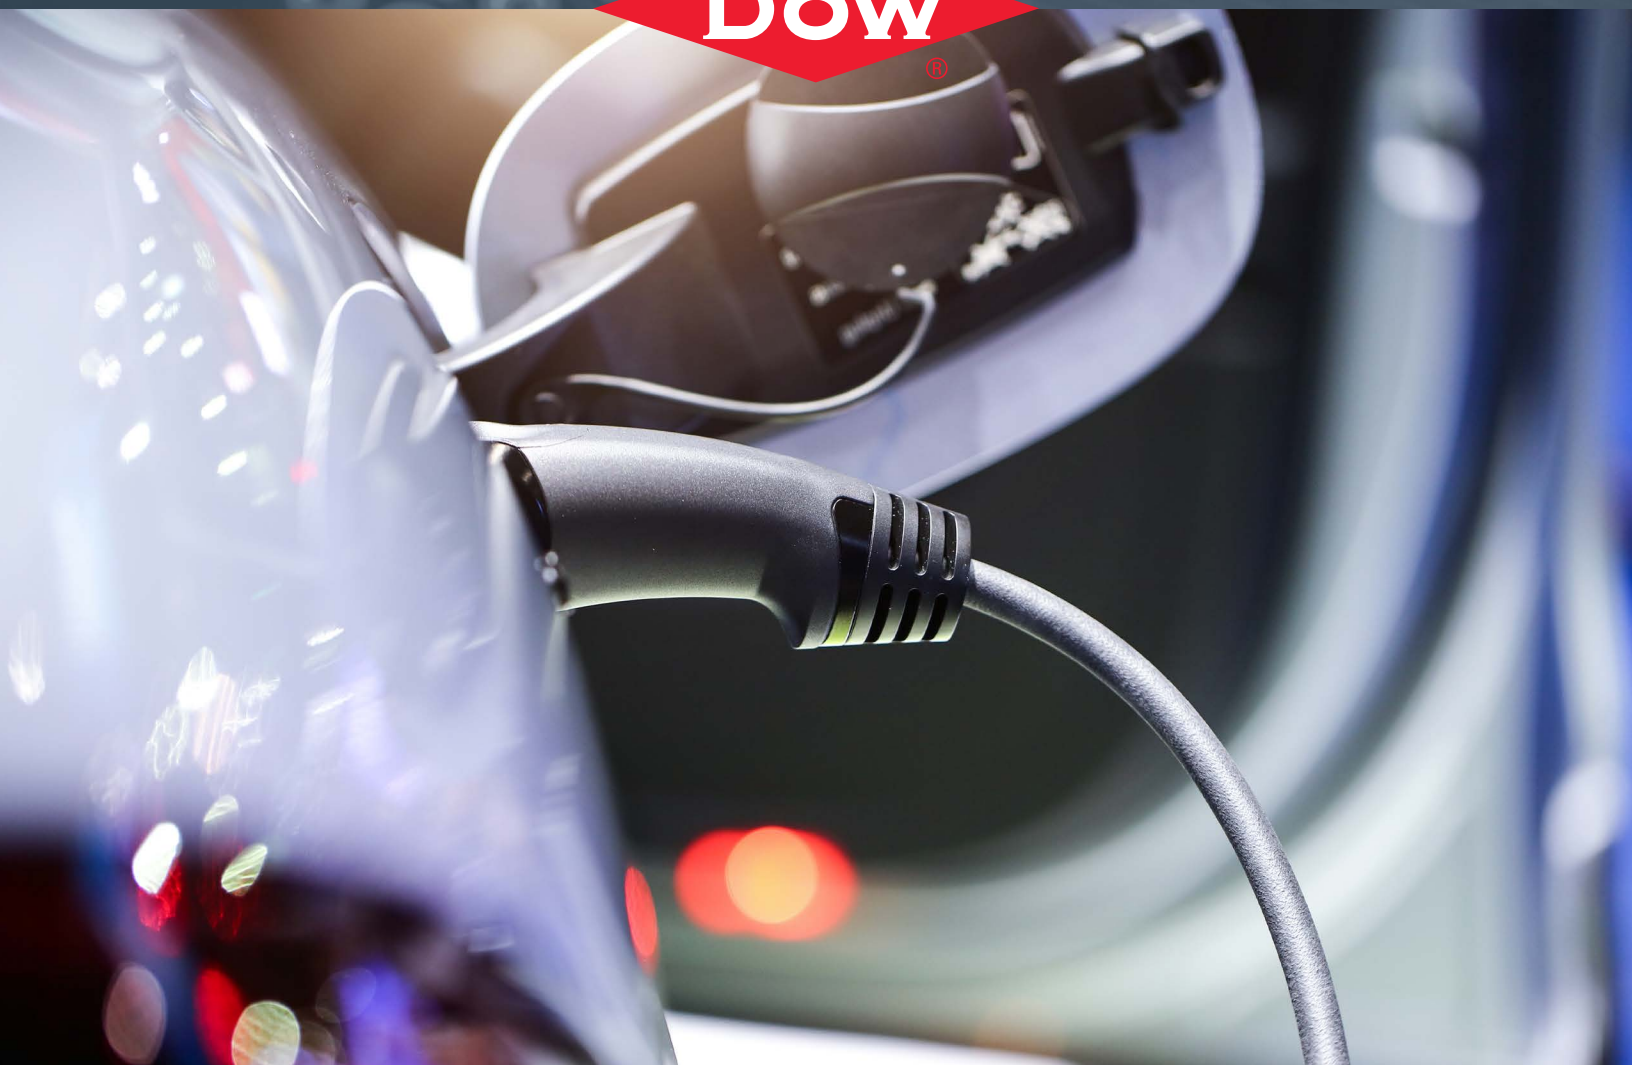
MOBILITY & TRANSPORTATION

Imagine designs for the future–today

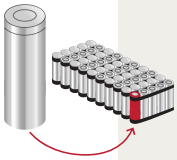
E-mobility materials selection guide

DOW®



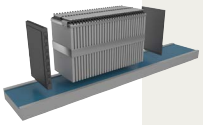
Designing *the future*

xEV Battery module designs



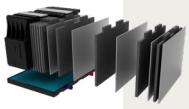
Cylindrical cells

These are the most common cell type in the battery industry. Used in specific electric vehicle applications, silicone materials supporting the use of more efficient, automated assembly processes deliver consistent performance.



Prismatic cells

As an increasingly popular alternative to cylindrical cells, their energy density offers performance improvements – while their shape simplifies the task of connecting cells together into battery packs. Due to higher energy density, sufficient thermal management is critical to manage the performance of these cell types.



Pouch cells

Comprised of thinly separated pouches, these cells require additional processing steps for assembly, due to their lack of rigidity. In return, they are able to deliver high specific energy, and application-specific customization. Selecting the right adhesives, encapsulants, and thermal management solutions for these varied battery forms is a critical process.

The market for plug-in hybrid and battery-powered electric vehicles (xEV) is on track to grow exponentially in the coming years, fueled by tumbling lithium-ion battery prices, favorable government policies, and aggressive plans from automakers to ramp up production. But realizing that potential will depend on a number of factors, including the industry's ability to meet consumer expectations for reliability, performance, and value.

This will challenge battery makers to design for the large-volume production of lithium battery packs that are smaller, lighter, and less expensive. These higher-energy-density packs will be capable of delivering more power, longer, through better thermal control.

Manufacturers and designers of other xEV components – including battery management systems, power control units, DC/DC converters, and electric motors – face many of the same thermal management, assembly, and protection challenges. We engineer new, innovative materials to help you create new, energy-efficient products. Let's find solutions. With excitement. With focus. With ingenuity. Together.

Silicone advantages

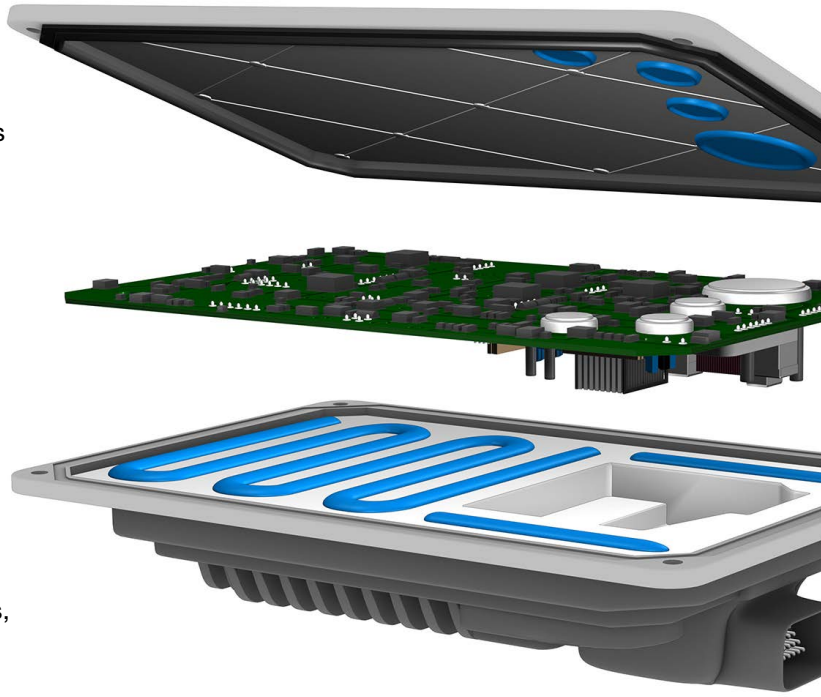
The silicone properties enabling Dow materials to excel in a wide range of electronics and automotive electronics and applications could prove invaluable in addressing challenges associated with designing, and producing large volumes of lithium battery systems and other components, for the electric vehicles of tomorrow. Some of silicone's inherent properties addressing these challenges are:

- Very low thermal resistance
- Flow, wetting, adhesion, and cure properties that can help speed and simplify processing
- Excellent thermal stability – wide operating temperature range
- Reliable performance under harsh conditions – resistance to thermal shock, oxidation, moisture, and chemicals
- Excellent electrical insulation (dielectric strength)
- Excellent stress relief
- Silicone foams enable light weighting

Materials innovation for thermal management

Thermally-conductive silicone materials from Dow have properties that can help you reduce operating temperatures, and extend the life and performance of batteries and other electronics in electric vehicles.

- **Thermal gap fillers** are soft, compressible, two-part silicone, high thermal-conductivity materials specifically formulated to process easily, and to effectively dissipate heat from critical automotive parts, such as battery packs or module assemblies, and other high-heat applications.
- **Thermally-conductive silicone adhesives** are used for coupling the battery pack to the cooling plate.
- **Non-curing, thermally-conductive silicone compounds**, with a possible applied temperature range of -40°C to 150°C, are used for conducting heat in ADAS modules.
- **Thermally-conductive silicone gels and encapsulants** are flowable materials that facilitate high-volume processes in automated production, and can be used as an alternative to pre-cured pads, to provide lightweight thermal coupling between cells and modules.



Proven solutions

Silicone adhesives, conformal coatings and encapsulants, foams, and thermal-management solutions have already demonstrated decades of proven performance under the harshest automotive conditions. They are resistant to shock, oxidation and moisture, and maintain their mechanical and chemical properties across operating temperatures from -40°C to 200°C.

- **Thermal-management materials –** From engineered elastomers designed for heat-resistant sealing and gasketing, to silicone gels and encapsulants for potting electronic circuitry in the battery pack's power-management system – thermal-management materials from Dow are consistently reliable.
- **Adhesives –** Used in a variety of applications, including staking large capacitors for vibration control, extra support for large components on circuit boards, electromagnetic shielding, and housing sealing, DOWSIL™ self-priming adhesives form long-lasting bonds without the need for mechanical fastening and clamping. In addition, many are re-workable to allow for easier module repair. They are typically solventless solutions that minimize the need for special storage, handling, or ventilation.
- **Foams –** Our silicone foams are designed for efficiency in processing. The two-part, RTV foams are dispensed directly on the part surface. Foams can be a lightweight alternative to traditional encapsulant and sealant options.
- **Conformal coatings –** Silicone conformal coatings offer an extraordinarily broad range of durometers, as well as extremely low modulus options. That means they deliver better stress relief on delicate electronics during thermal cycling. DOWSIL™ conformal coatings come in a range of viscosities to help you meet all of your processing and application demands.

DOWSIL™

silicones by DOW

Innovative technologies

Meeting the needs for performance, design flexibility, and cost control

DOWSIL™ EA-4700 CV Adhesive

Designed for automotive applications where fast curing to achieve adhesive and sealing performance is critical, including electronic control units, sensor modules, and battery pack applications where lid seal, base plate attaching, gasketing, or connector sealing is required.

DOWSIL™ TC-4535 CV Thermally Conductive Gap Filler

Designed to dissipate the heat from electronics to heat sink, this gap filler provides a reliable cooling solution for engine or transmission control units, on board chargers, or in battery packs or modules.

SILASTIC™ 3-8186 Thixotropic Foam

Designed to form dispensed-in-place compression gaskets in applications that require low-sealing force. Uses include sealing automotive components and lighting.

DOWSIL™ EC-8425 Adhesive

Designed for electromagnetic interference shielding or grounding applications where durable mechanical and conductive properties together with reliable performance at high temperature and vibration are required. Provide unique elastomeric behavior combined with strong and reliable adhesion with high conductive properties.

Improved thermal conductivity, easier processing, and long-term performance stability

The versatile properties of silicones enable highly tunable performance attributes that are driving new innovations for streamlining assembly, and enhancing the performance of advanced automotive batteries. Besides designing new materials to meet specific performance and processing requirements, Dow offers many proven, innovative, and emerging silicone technologies for xEV applications.

Materials solutions, expertise, and collaboration from Dow

Established specifically to explore and develop the potential of silicones, Dow is a global leader in silicones, silicon-based technology, and innovation. We bring decades of success in game-changing materials innovation for the world's transportation industry, as well as specific expertise in the development of performance-enhancing and enabling technologies for automotive applications.

To help make electric vehicles a high-performing, cost-effective transportation alternative, Dow is investing in new solutions for the design and assembly of xEV applications. And we are looking for opportunities to collaborate with battery cell makers, system designers, assemblers, tier suppliers, and vehicle OEMs to improve the efficiency and reliability of next-generation battery packs and systems.

Learn more

We bring more than just an industry-leading portfolio of advanced silicone-based materials. As your dedicated innovation leader, we bring proven process and application expertise, a network of technical experts, a reliable global supply base, and world-class customer service.

To find out how we can support your applications, visit **dow.com/e-mobility**.
